Exercise 12: SAT Verification Plan

Objective: *Introduction to verification planning.*

Task: *Create a verification plan for the Saturation Filter.*

The files for this exercise are in `<ROOT>/lecture08/exercises/E12_sat_verification_plan/`.

In this exercise you are going to create a verification plan for the *Saturation Filter*. You can find the requirements for both the *Saturation Filter* and the *sSDT* protocol in `<ROOT>/lecture08/exercises/exercise_general_info.pdf`.

Use `template_svp.csv` to create the verification plan. As the columns in the template describe each entry into the verification plan should specify:

1. The targeted design requirement
2. The coverage to collect, if applicable.
3. The verification criteria, i.e. how is the requirement checked.
4. The verification priority.
5. Type, i.e. where is this requirement coming from (Design/Protocol).

Before creating the plan, read `<ROOT>/lecture08/exercises/exercise_general_info.pdf` again and use the design requirements for the *Saturation Filter* and the *sSDT* protocol requirements as the source for the plan.

After creating your plan review your solution from *Exercise 11: Reference Model and Scoreboard*:

- Does the testbench implement everything described by your verification plan?
- If not, what additional tests, coverage or checkers need to be implemented?
